Dr. Elizabeth Allen is an NIH funded post-doctoral associate in the Cancer-Related Health Disparities Education and Career Development Program. She earned a PhD in occupational and environmental epidemiology and an MPH in environmental health from the University of Minnesota School of Public Health. Her dissertation work was a comprehensive assessment of overall health and lung cancer risk of Minnesota taconite mining workers. Dr. Allen received extensive training in identifying causes of occupational related diseases, and improving the overall health of working populations though a pre-doctoral fellowship with the Midwest Center for Occupational Health and Safety’s Occupational and Environmental Epidemiology training program. During her post-doctoral fellowship, she has expanded the substantive areas of her research to include barriers to accessing primary healthcare services among racial and ethnic minorities and low socio-economic groups. Through her fellowship, she has received additional training in conducting community-engaged research focused on reducing health disparities.

“Health of Minnesota Taconite Mining Workers: Lessons Learned and Future Community-Engaged Research”
